RETHINING. LOGISTICS

This semester, our studio focused on Rethinking Logistics: a deep investigation into one of today's most overlooked typologies. While warehouses, logistics hubs, and data centres are often dismissed as generic or purely technical, the studio approached them as essential infrastructures with significant impact.

Throughout the semester, we collaborated with experts from Henning Larsen, Ramboll, the Urban Land Institute (ULI), and Panattoni.

Table of contents

1. The problem with trucks

4. Drones: the soulution

6. Old vs. new crossdock

The problem with trucks

Despite only moving 19% of global freight,
are trucks accountable for 69% of global transport emissions

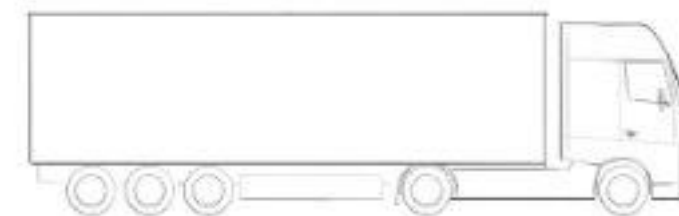

One truck degrades the road as much as 15,000 cars

Every truck needs a driver

Trucks are big, loud and incovinient in dense cities

Trucks suck...

What if there were no trucks?

Drones: the soulution

Drone technology has advanced rapidly in recent years. Major players, such as Chinese operators and Amazon, are already delivering consumer goods at scale in major metropolitan regions. At the same time, smaller companies like Zipline and Aviant are transforming last-mile delivery by making food and essential supplies faster and more convenient than ever before.

As drones mature, a new question emerges: how will the supply chain evolve once the supporting infrastructure catches up?

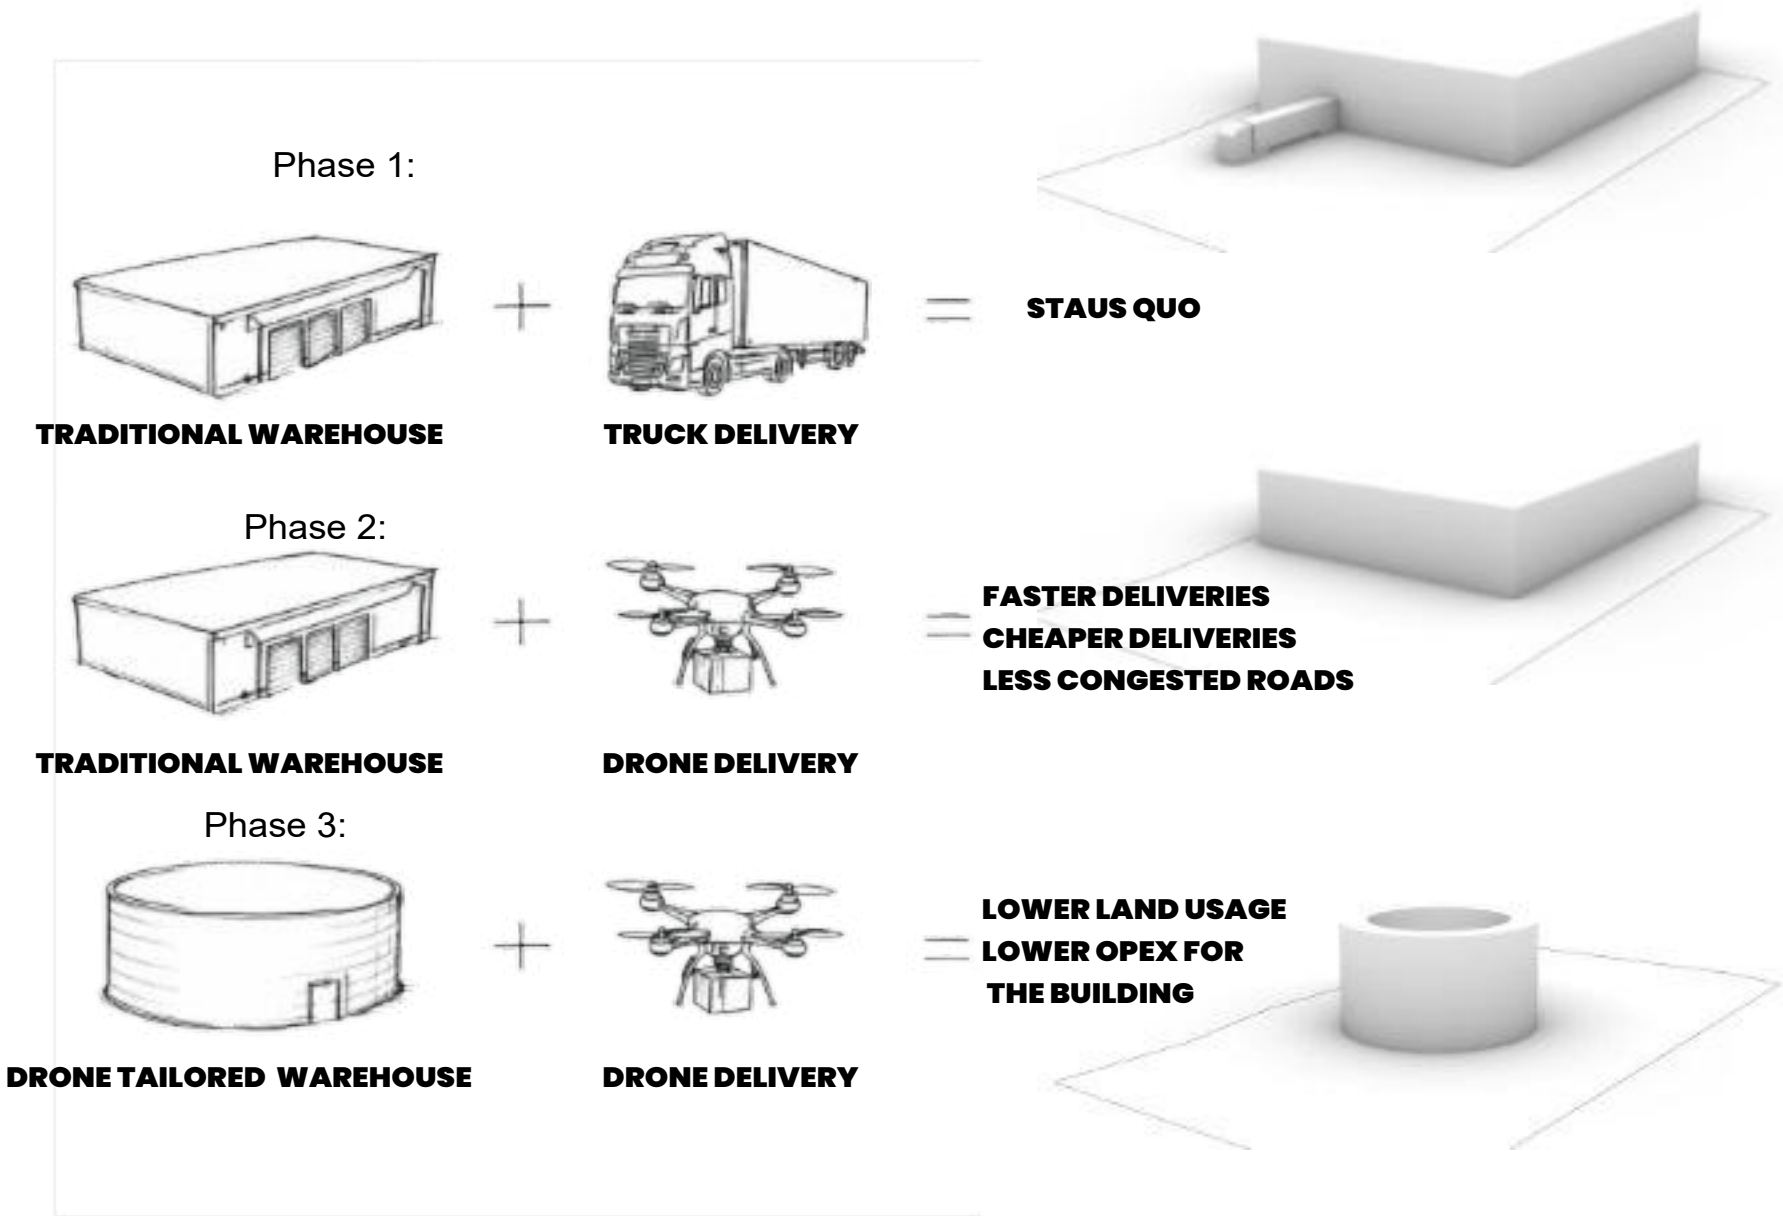

Why drones?

Drones can have up to 94% lower energy consumption per package than other vehicles

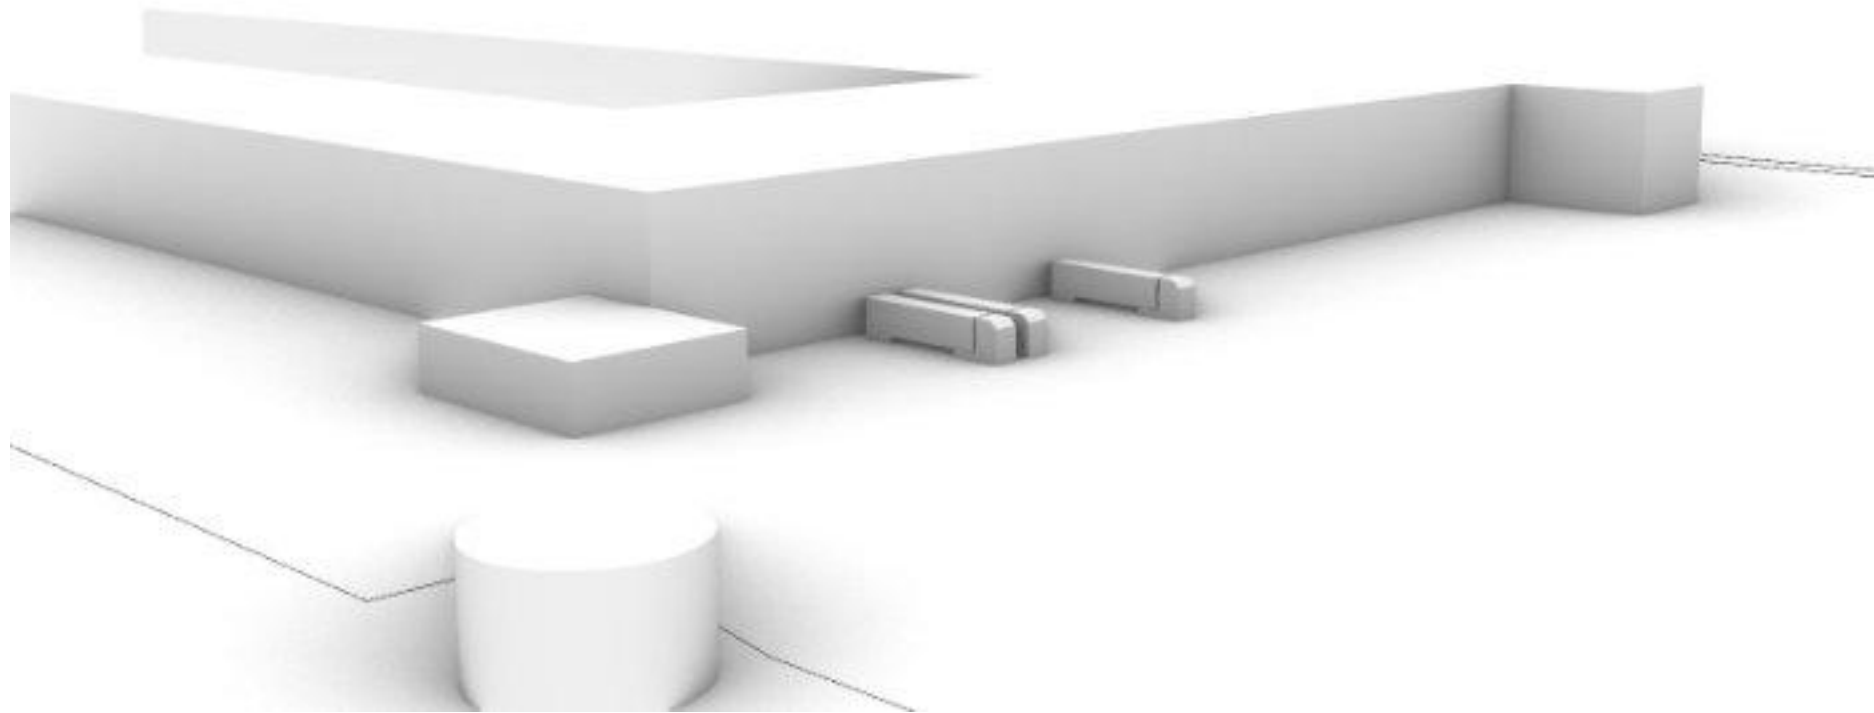

One last mile autonomus drones are already cheaper to deliver then trucks or a van

Modern drones are safe: Zipline has had no major accident with 00,000+ deliveries

Drones dont congest and degrade public roads

Old crossdock

New crossdock
