The problem

Logistic centers today are built as rigid, oversized structures that lack any room for growth. Consumer demands are changing rapidly and logistic centers need to match the speed of today's fast-paced world. Ones placed near residential zones offer little to no consolation and are an eyesore as well as potentially noisy. Rethinking Logistics studio challenges us designers to assess current warehouses and how they are changing and apply it with our own intervention.

The solution

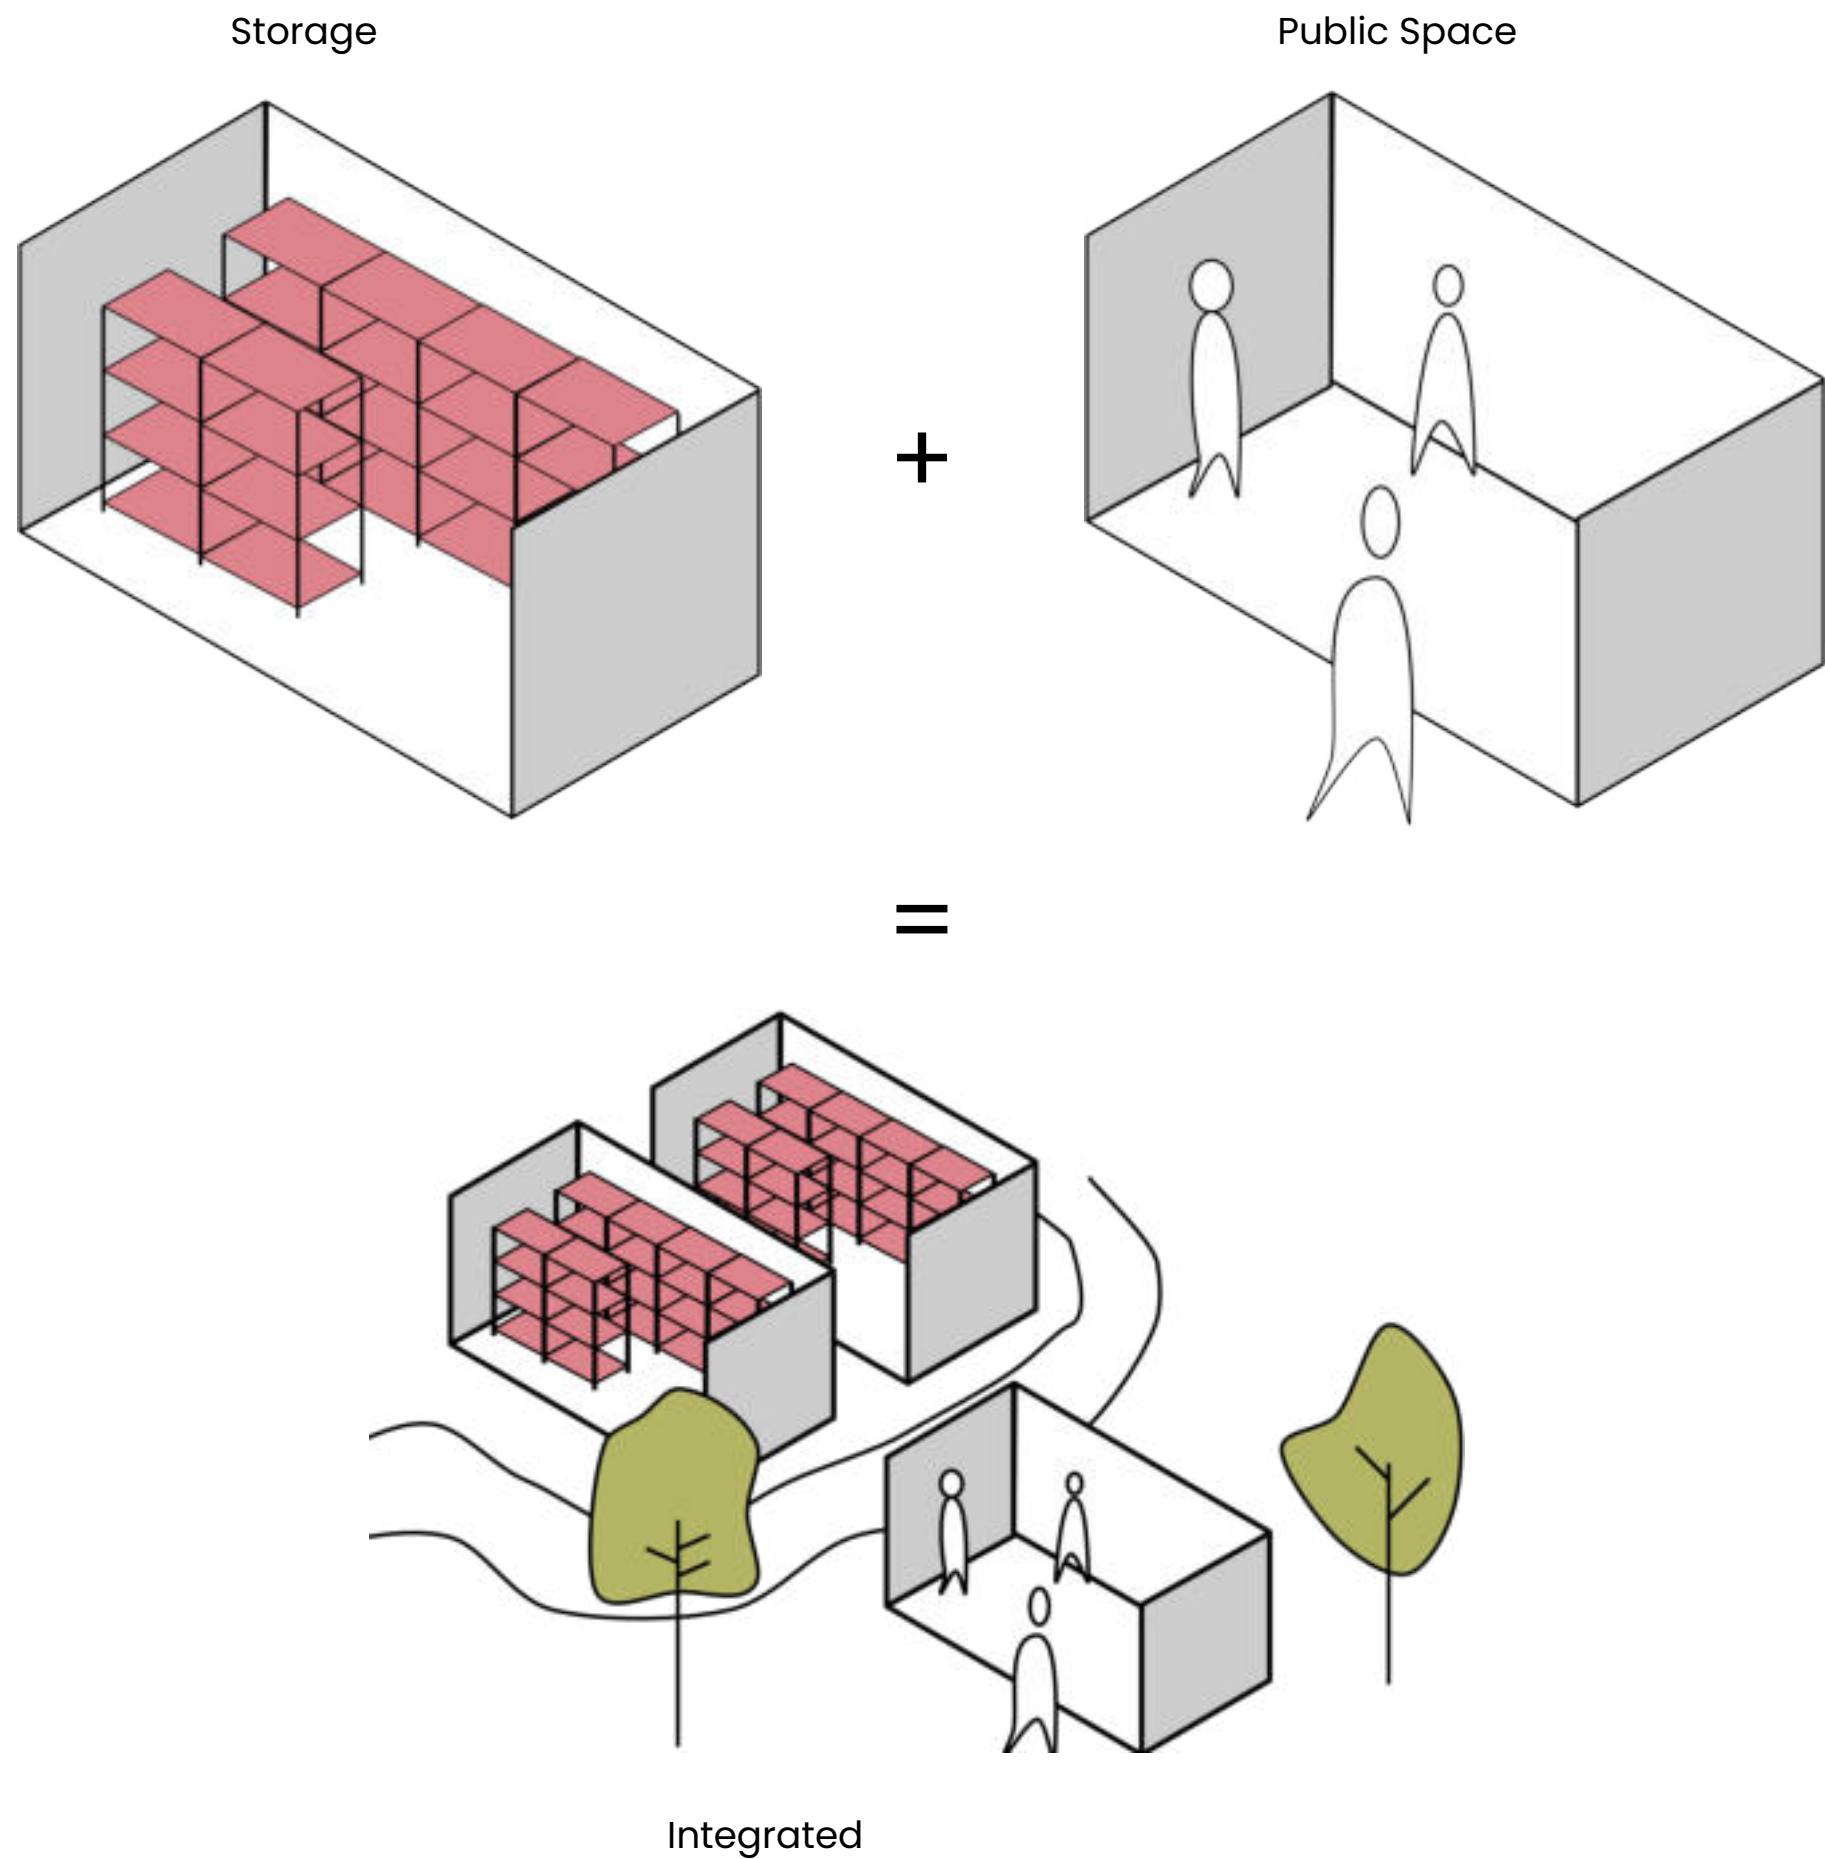

Tackling storage warehouses, Nomadic Logistics takes a look at the rigidity and lack of flexibility as the target issue. Adapting to a temporary module storage warehouse system provides room for growth, flexibility for the company and optimizes the space being used. Storing goods from small parcels to big box storage, countless configurations can be designed using the designed block system which has already been proven to work on an exhibition scale. Integrating public spaces like festivals, markets, exhibitions, education centers, etc. also brings the human connection to logistics.

Company: Showblock

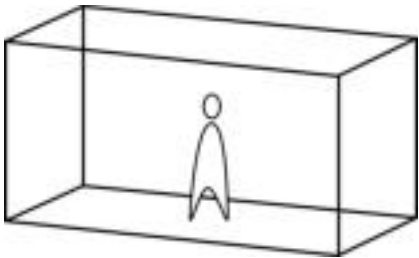

Concept

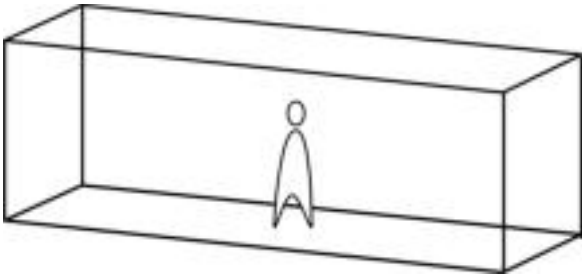

The blocks

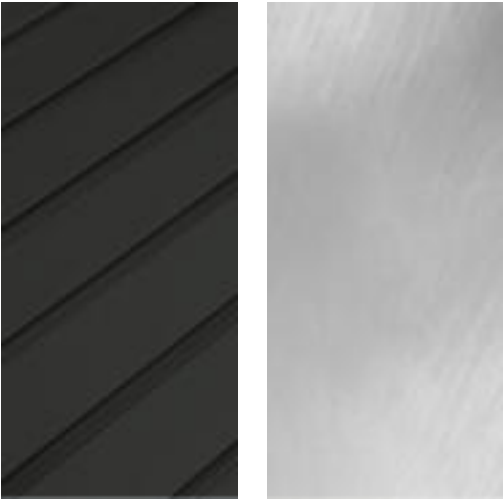

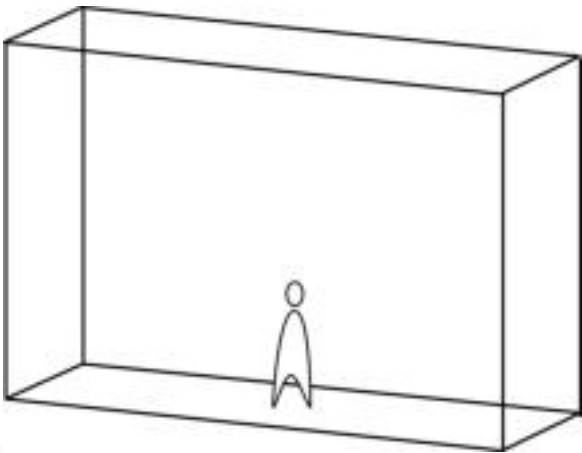

5760mm x 2880mm x 2880mm

8640mm x 2880mm x 2880mm

8640mm x 2880mm x 5760mm

Temporary floor paneling:

Made from aluminum for stability where needed, 50 linear meters can be fitted by 2 people in 1 to 2 hours

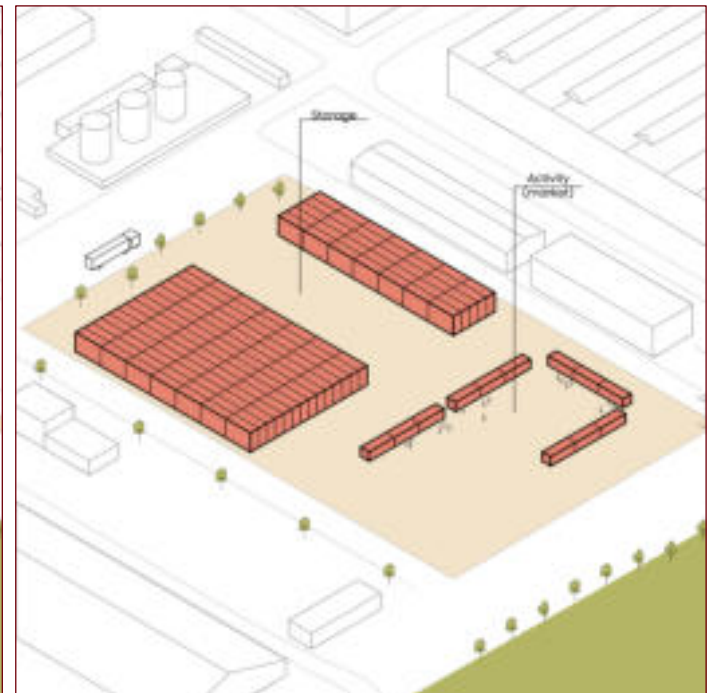

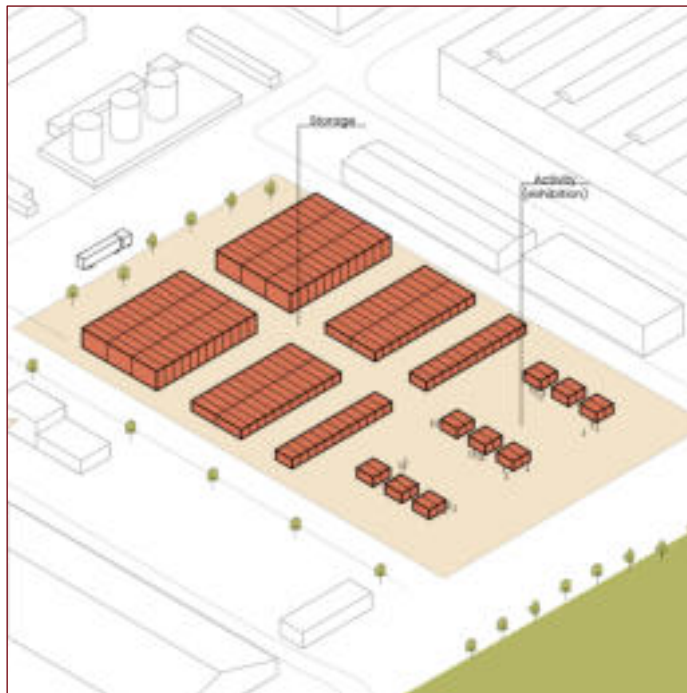

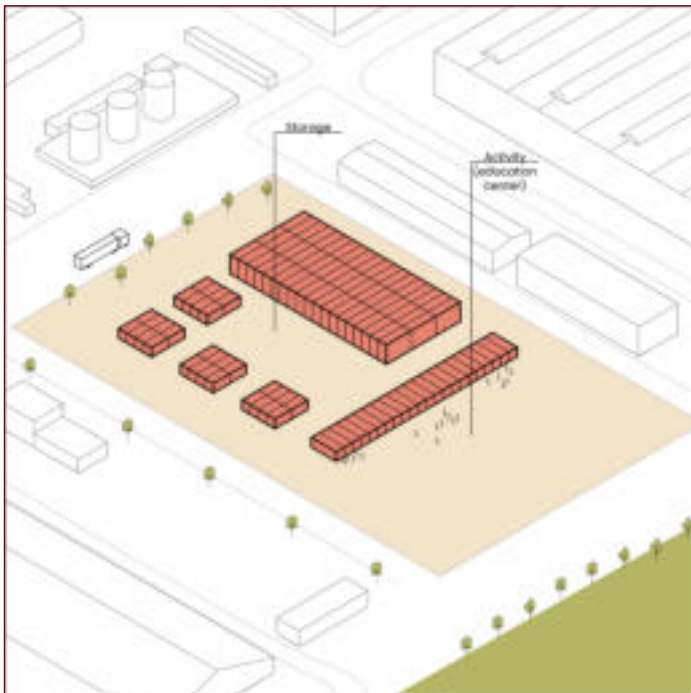

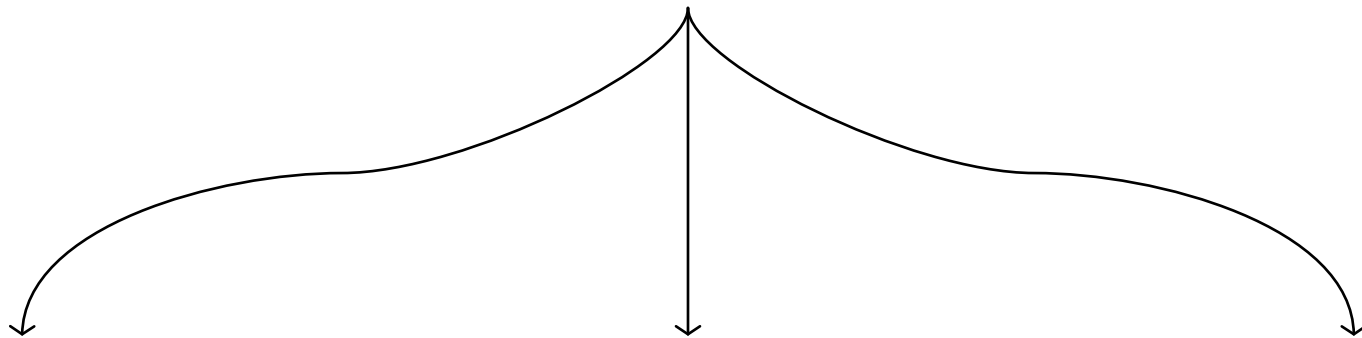

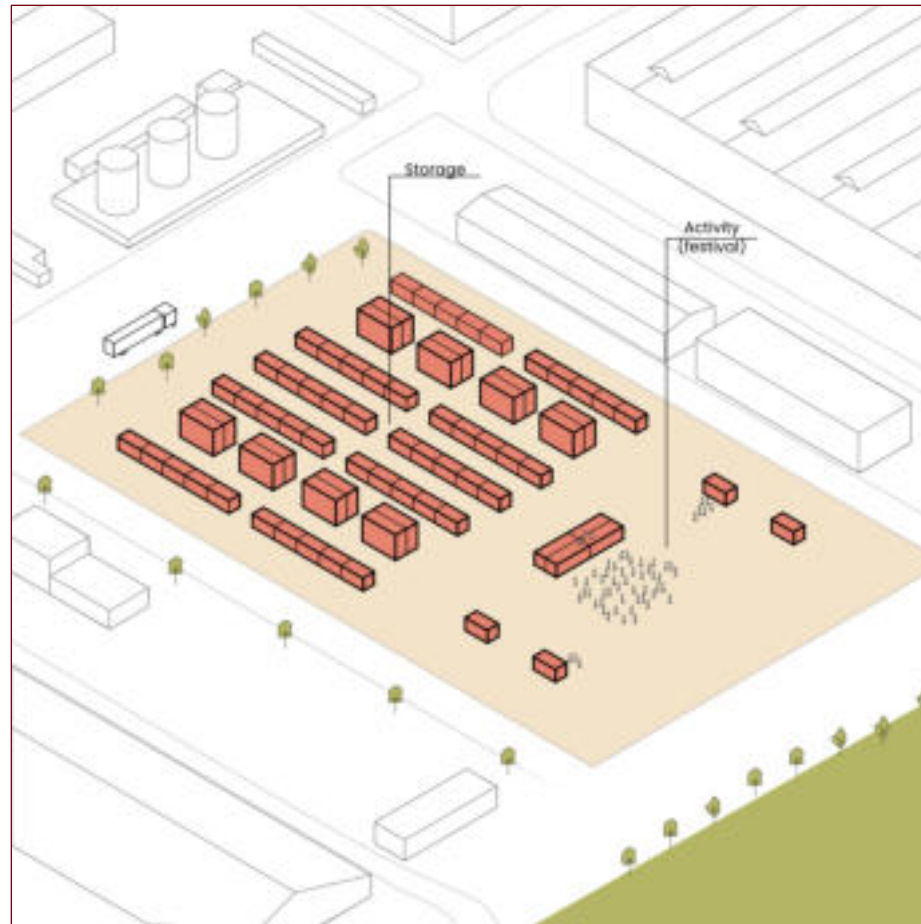

Material:

Exterior finish: Aluminum 6063-T6

Structural system: Steel S355 framework

Flexibility

There are countless configurations of block orientation and combinations of sizes based on the integrated public space and what is being stored.

There can be countless types of public spaces and **activities**. A few include...

Festival

Exhibition

Market

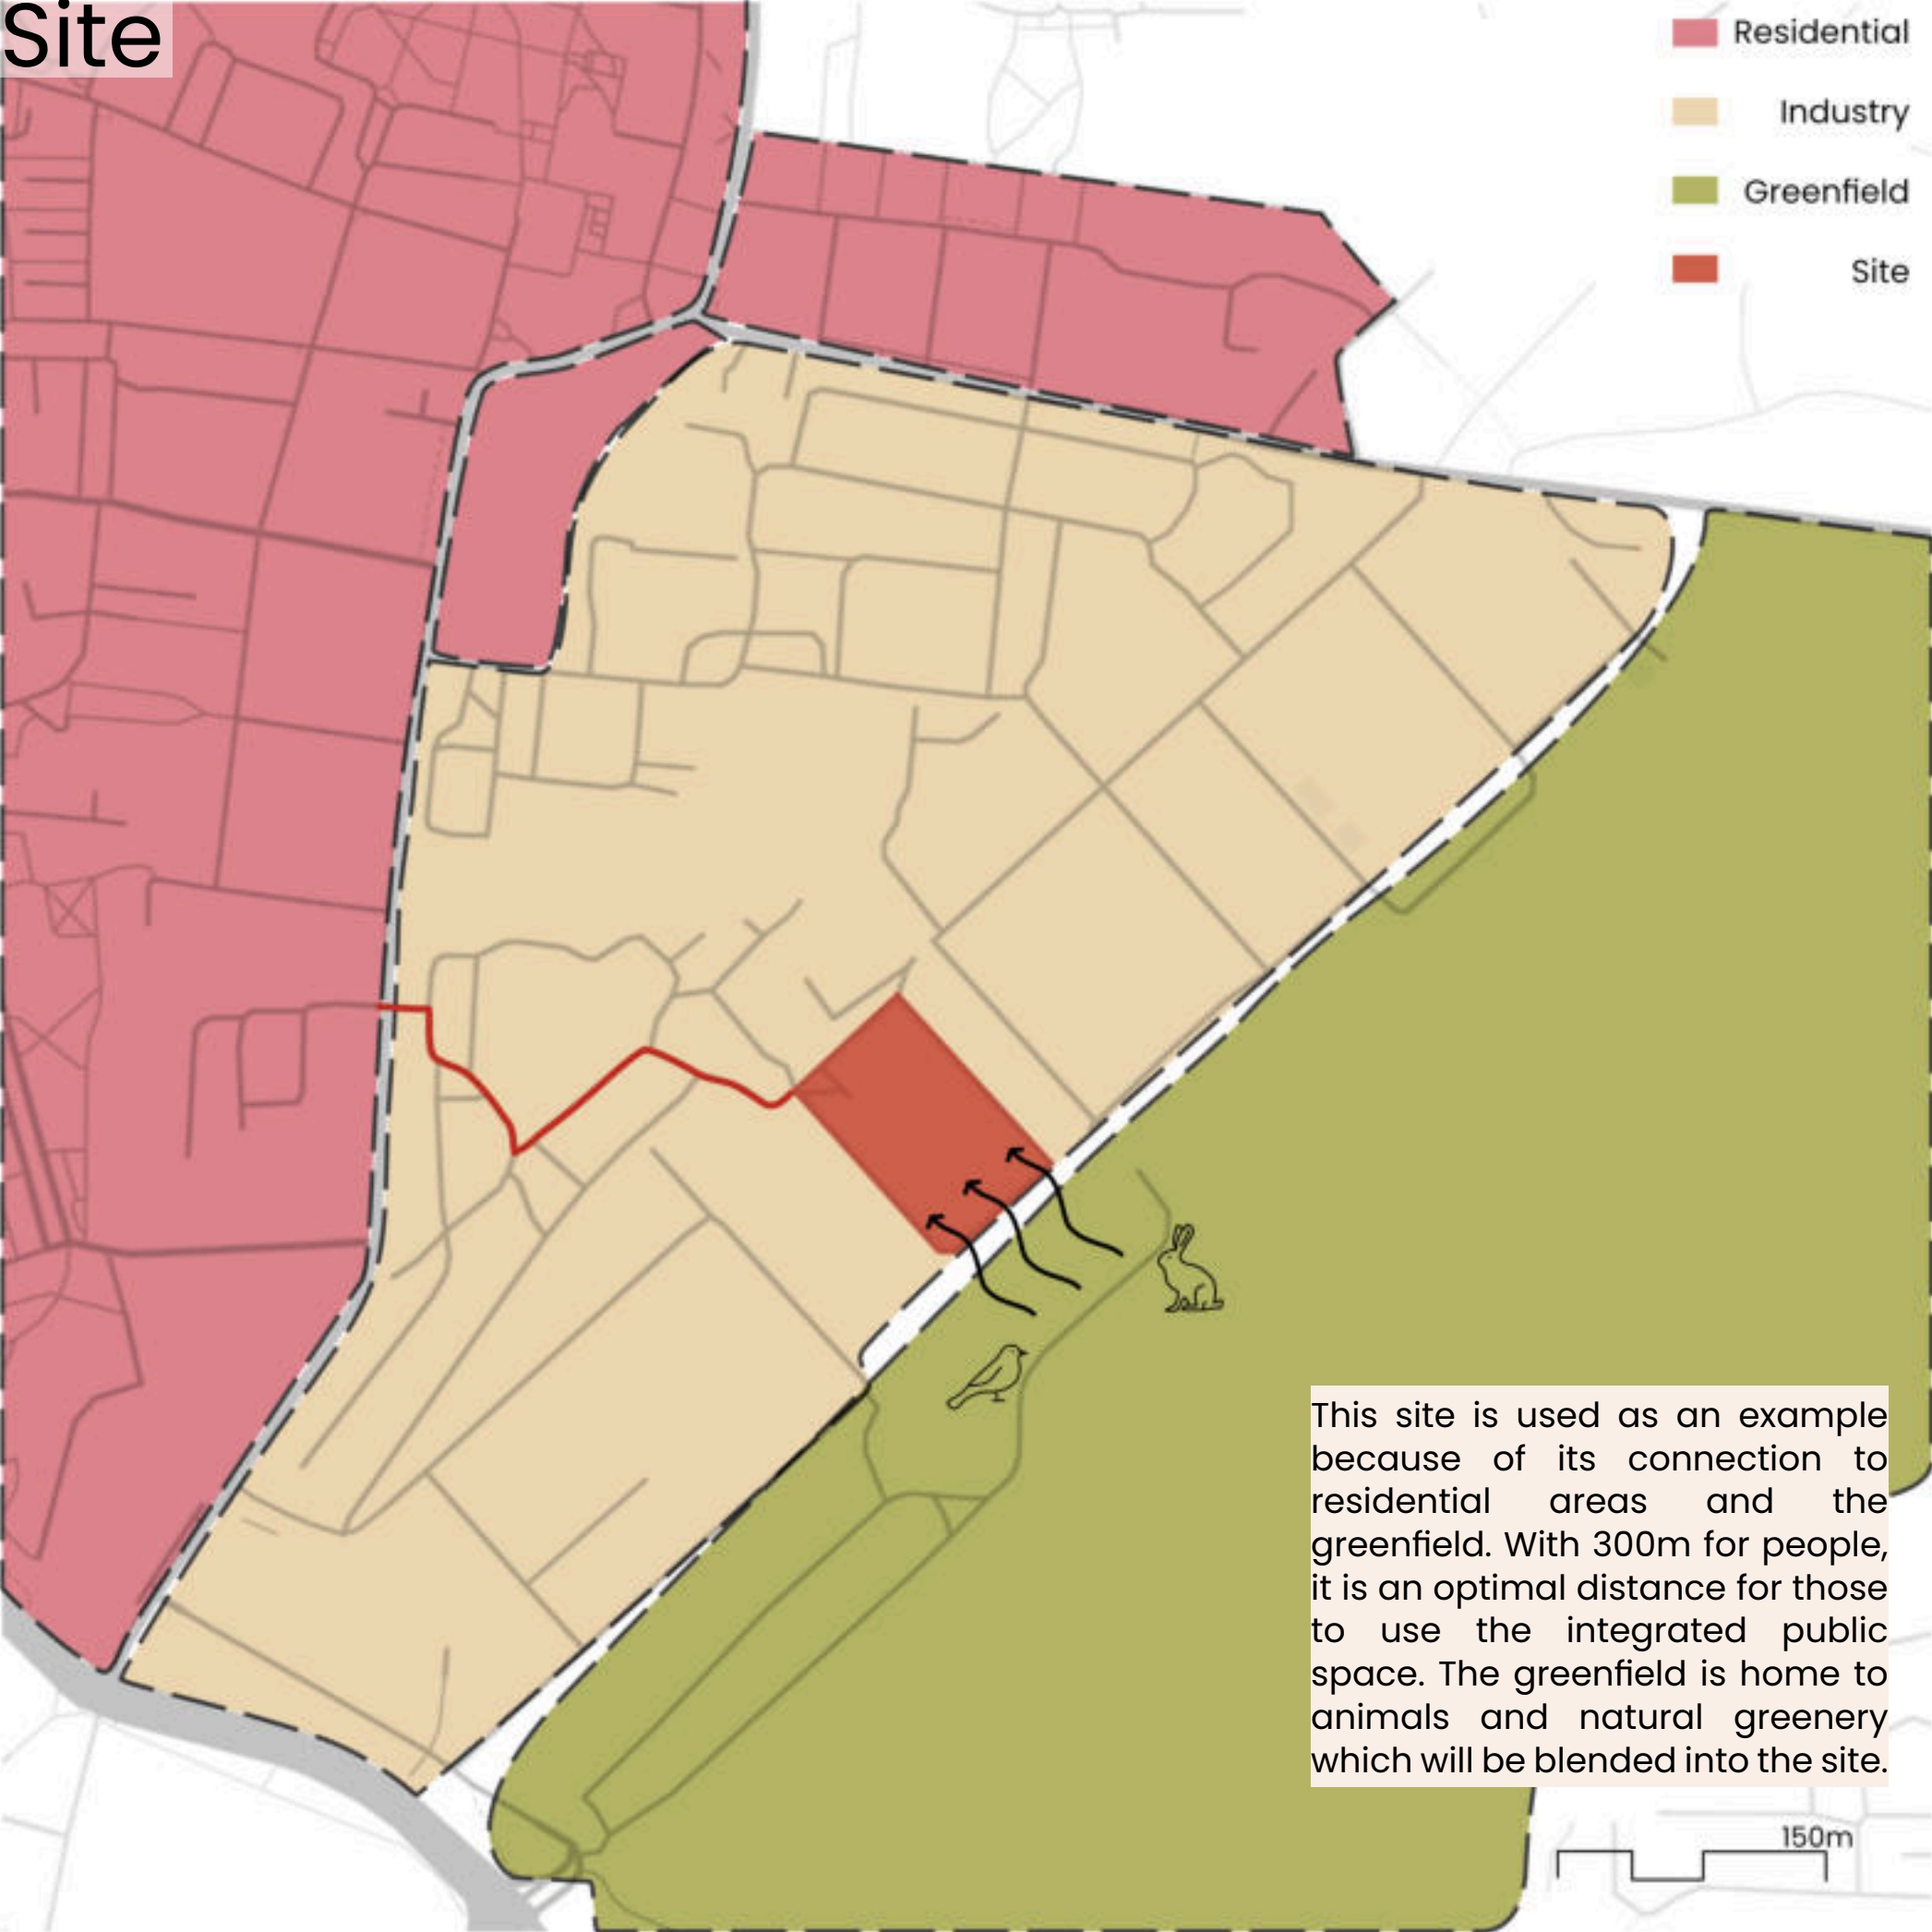

Education Center

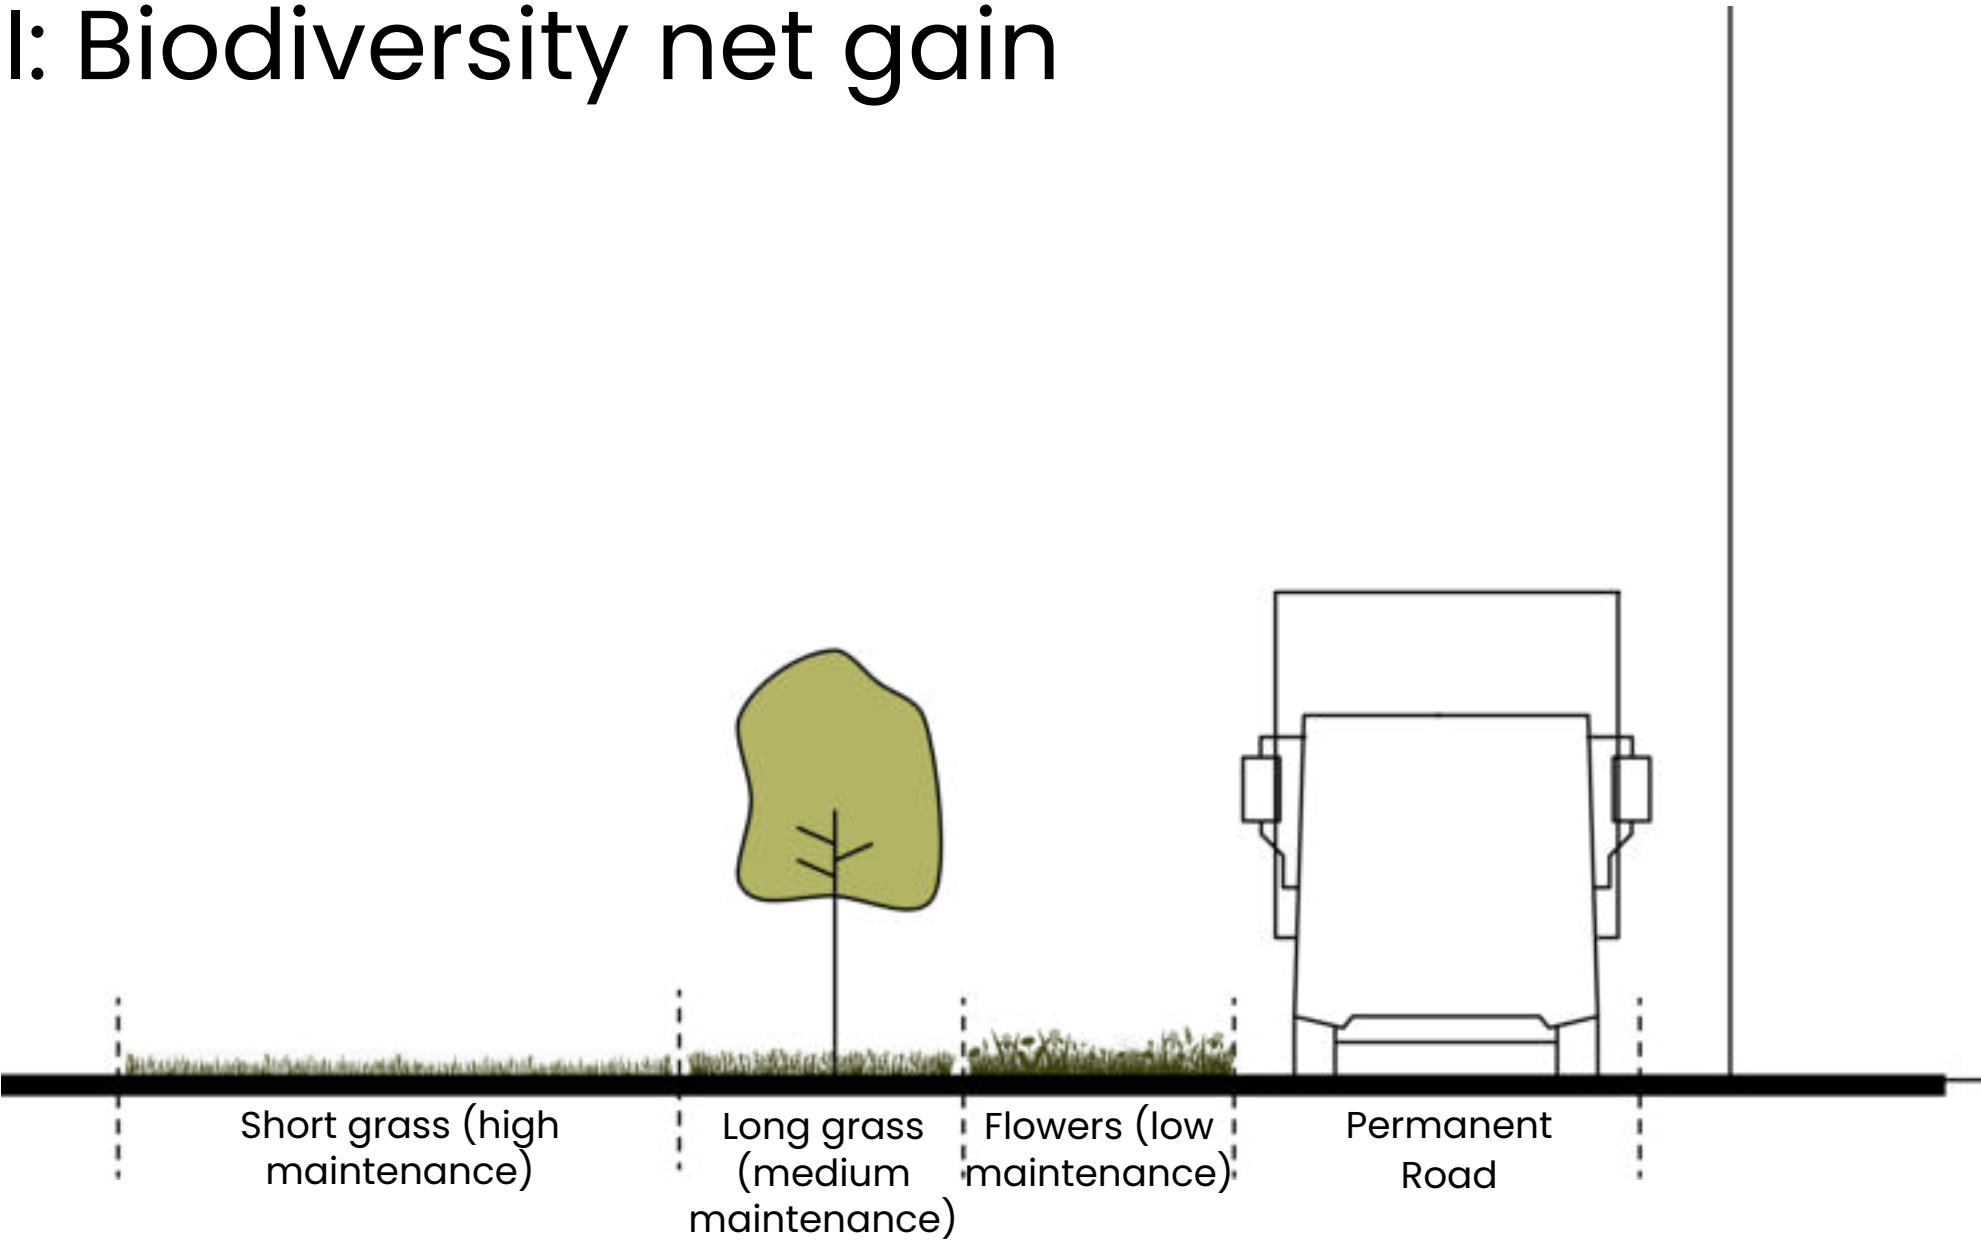

Site

- Residential
- Industry
- Greenfield
- Site

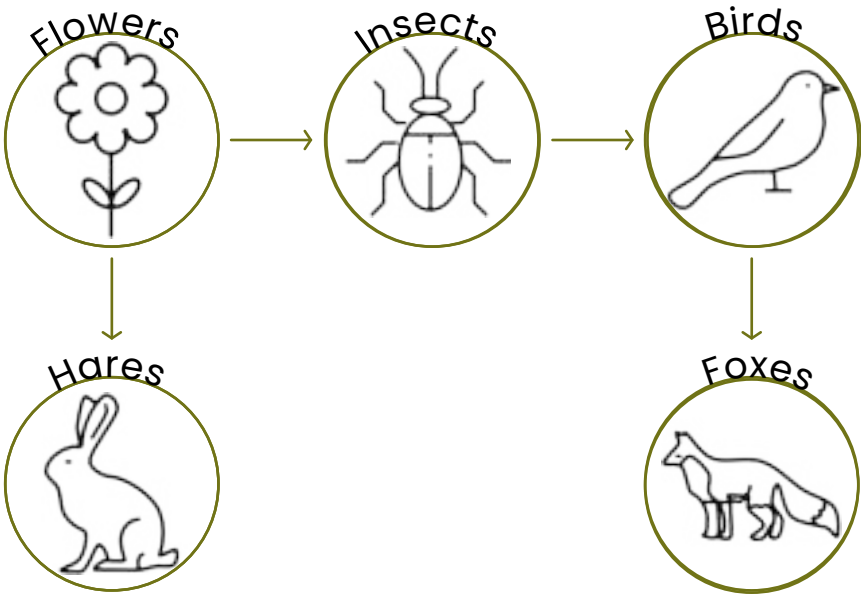

This site is used as an example because of its connection to residential areas and the greenfield. With 300m for people, it is an optimal distance for those to use the integrated public space. The greenfield is home to animals and natural greenery which will be blended into the site.

KPI: Biodiversity net gain

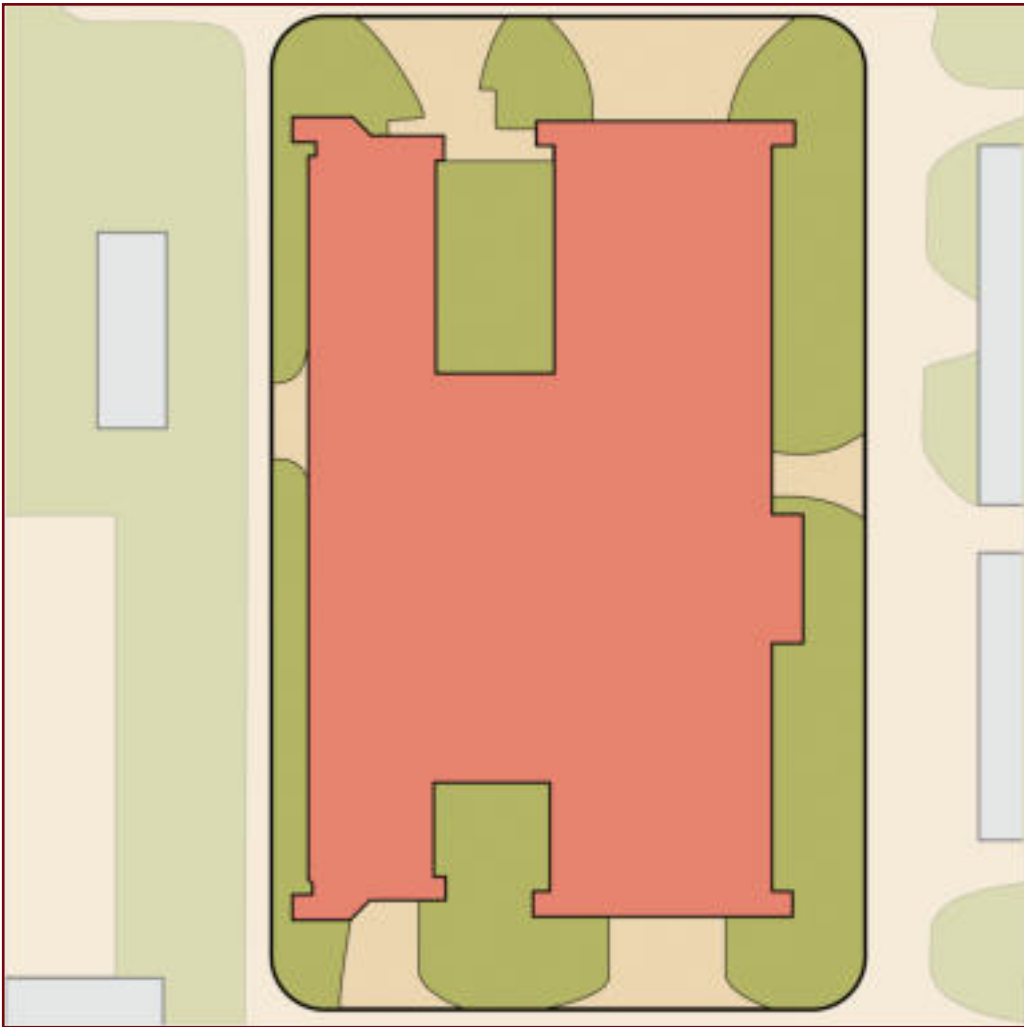

KPI: Biodiversity Gain

The KPI calculates the percentage increase in biodiversity achieved through habitat creation/restoration compared to the site baseline. Since the site is located adjacent to a field animals like hare, and foxes can easily access it. Introducing a gradient of greenery as shown above will provide flowers for pollinators and insects to cross between. This then causes the food chain to expand to birds as well.

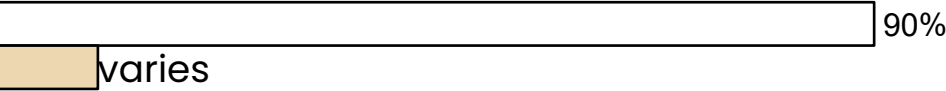

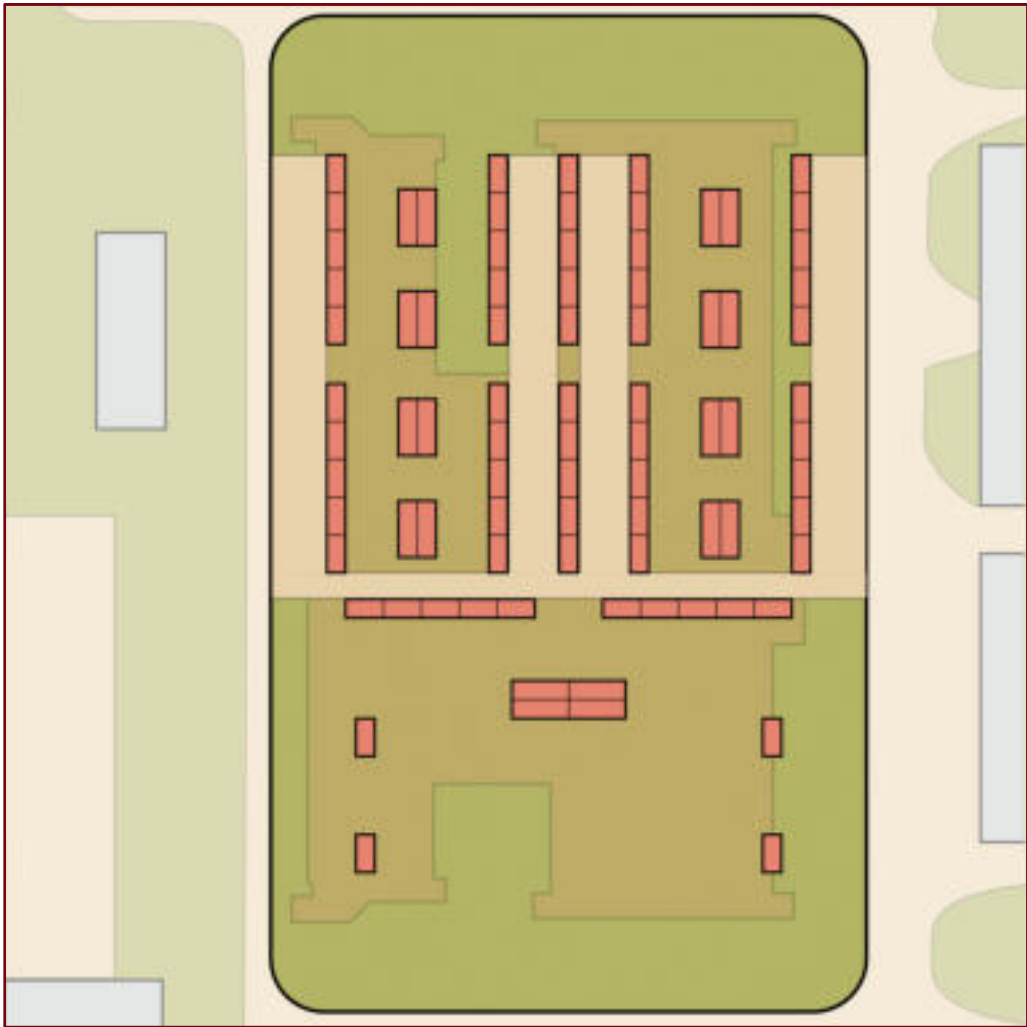

KPI: Area Covered

Old Site

188%

KPI: Area covered

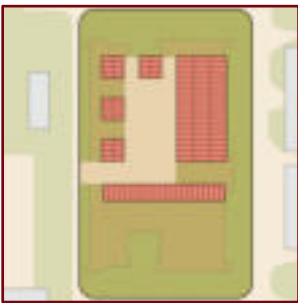

Measures the total edge length relative to the total area, indicating how much the structure breaks up the landscape. The temporary modules cover less area than the previous permanent structure. When there is a plan present the increase is dramatically positive. Then when the storage is not needed anymore the site is disassembled and left a grassy plot.

128.7%

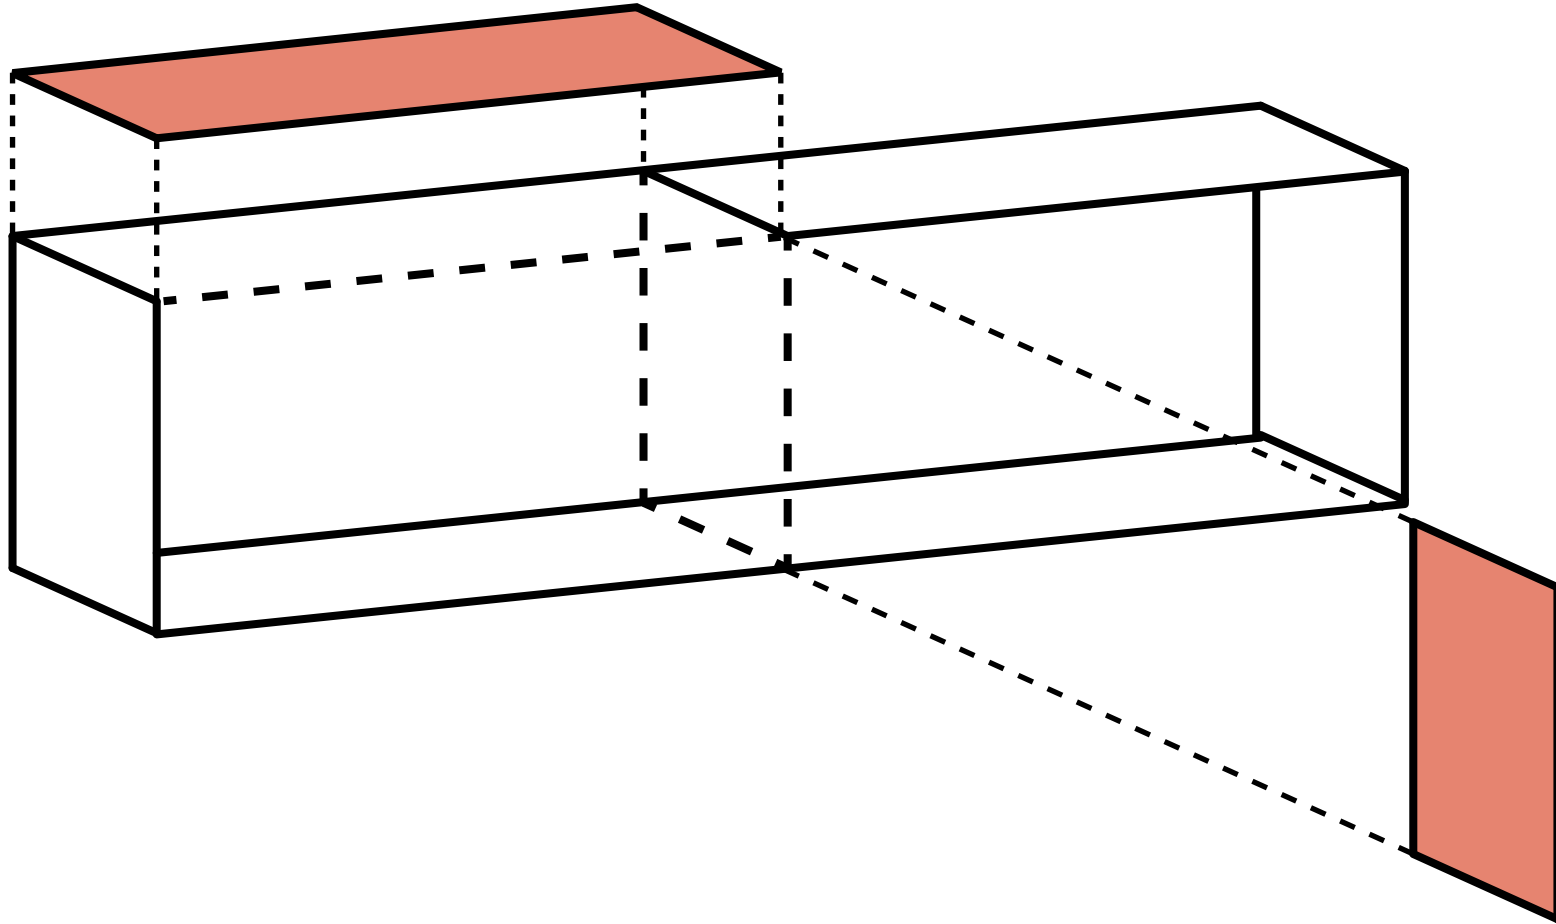

51%

173%

KPI: Disassembly score

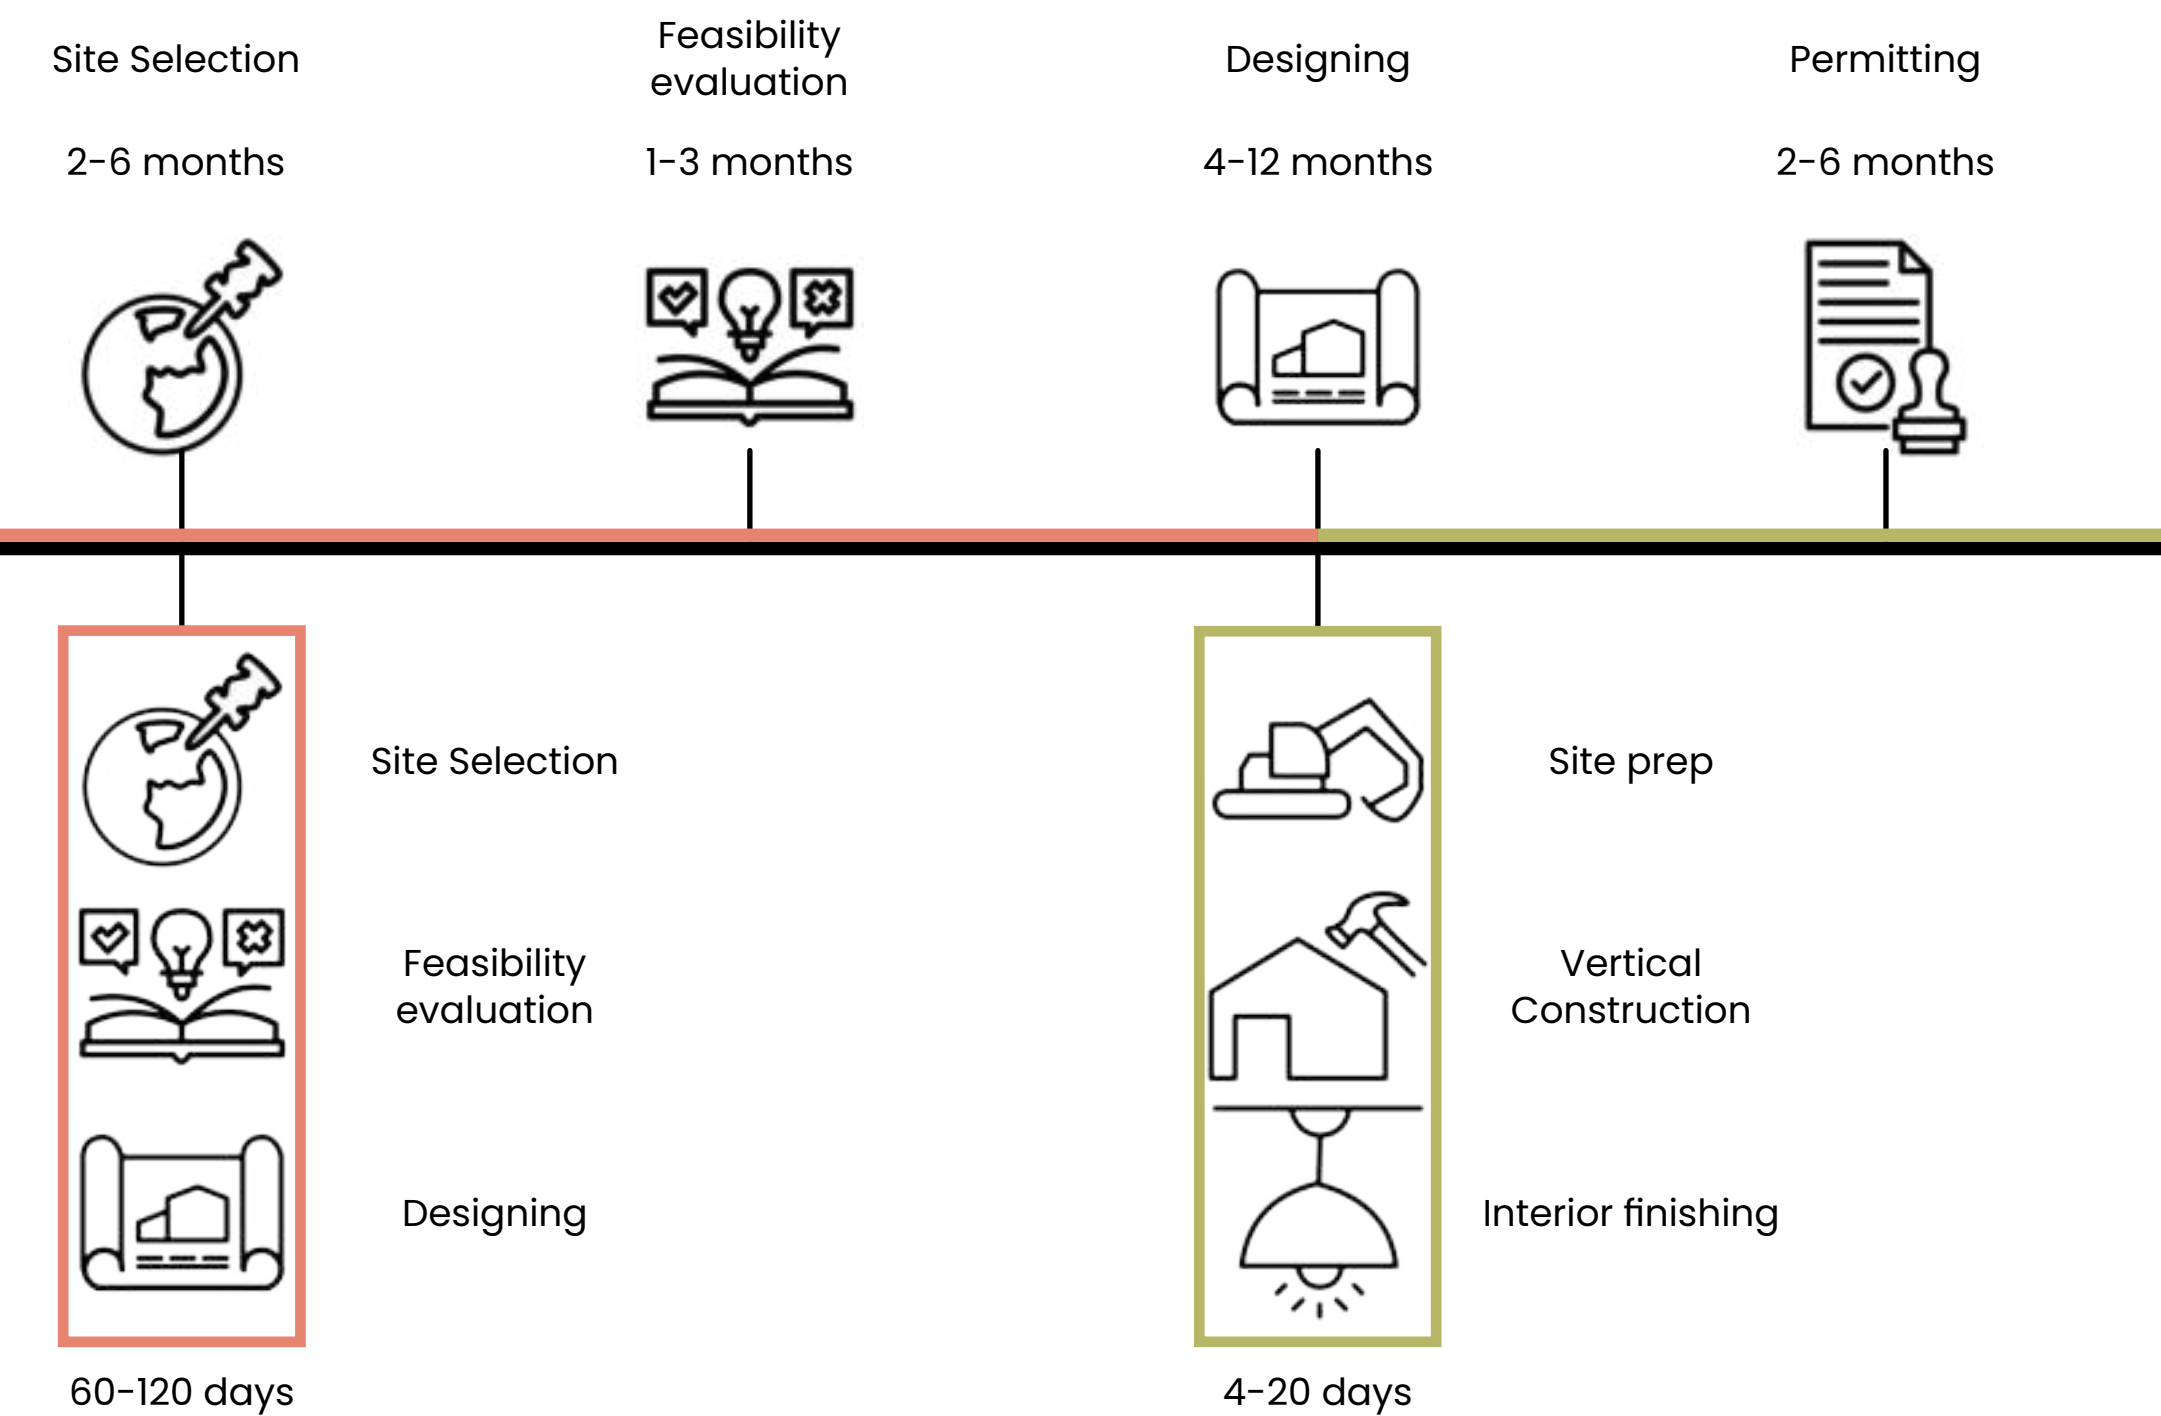

KPI: Disassembly score

Measure the ease, efficiency, and non-destructive potential of taking a product or building apart at the end of its life. The prefabricated containers are built off-site and transported to be assembled in the chosen configuration. When the containers are placed next to or on top of each other the touching faces can be removed to create a large volume. In the case of needing a flat ground, temporary aluminum panels will be placed which also can later be disassembled and transported with the containers.

Timeline comparison

Average logistics center lifecycle

Temporary module storage warehouse

Site prep

1-2 months

Vertical
Construction

4-8 months

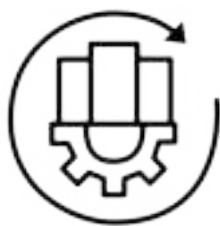

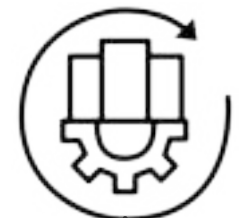

Interior finishing

1-2 months

Redevelopment
evaluation

every 10-14
months

Redevelopment
evaluation

Configuration can last from
3-5 months up to 3 years to
avoid difficulty with permits

Adaptability

This concept is not just for this selected site, it meant to be moved around. Combining the size of storage, activities, and layouts provide countless options. Limitations however do arise in that the configurations cannot surpass the three year benchmark, and the parcels cannot exceed big box storage. But like all ideas, not everything is for everyone; and the benefits far outweigh the drawbacks for those companies that would find use with **Nomadic Logistics**.
